# Automotive Security Today

## Growth of Connected Vehicles

The number of connected vehicles is rapidly increasing.

Projections indicate that over **327 million connected vehicles will be in service by 2027**, encompassing advanced mobility platforms such as autonomous vehicles and electric vertical take-off and landing vehicles.

This surge significantly **expands the number of vehicle endpoints exposed** to potential cyberattacks.

## Expanded Attack Surfaces

Modern vehicles integrate numerous electronic control units (ECUs) and communication interfaces, including Bluetooth, Wi-Fi, and cellular networks. This complexity introduces multiple potential entry points for cyberattacks.

- Infotainment systems:** Vulnerable to control override and injection attacks.

- Telematics units:** Susceptible to unauthorized remote access.

- On-Board Diagnostics (OBD-II) ports:** Can be exploited for direct access to vehicle networks.

## Escalating Cybersecurity Challenges

The automotive industry faces significant cybersecurity threats, including **compromised safety, privacy breaches, financial losses, and reputational damage**.

Automotive cybersecurity market is projected to grow from **\$3.9 billion in 2023 to \$5.9 billion by 2025**, reflecting the industry's response to these escalating threats.

## State-of-the-Art documents for EUCC

To support the Implementing Act on the European Cybersecurity Certification Scheme on Common Criteria, EUCC, ENISA is publishing the related state-of-the-art (SotA) documents listed in its Annex I to clarify the understanding of requirements on specific scopes of assessment. As mentioned in the Implementing Act, a 'state-of-the-art document' is a document which specifies evaluation methods, techniques and tools that apply to the certification of ICT products or security requirements of a generic ICT product category in order to harmonize evaluation in technical domains or of protection profiles.

State-of-the-art documents may have 2 different statuses.

- The first is: "adopted with the EUCC Implementing Act or its amendments".
- The second is: "draft". State-of-the-art documents labelled as "drafts" have been endorsed by the ECCG as per the [linked opinion](#), and are planned to be included in the Annex 1 of a next to come amendment of the scheme.

### Using Fault Injection to Verify an AUTOSAR Application According to the ISO 26262 [2015-01-0272](#)

The complexity and the criticality of automotive electronic embedded systems are steadily increasing today, and that is particularly the case for software development. The new ISO 26262 standard for functional safety is one of the answers to these challenges. The ISO 26262 defines requirements on the development process in order to ensure the safety. Among these requirements, fault injection (FI) is introduced as a dedicated technique to assess the effectiveness of safety mechanisms and demonstrate the correct implementation of the safety requirements.

## Applus+ experience on automotive penetration testing

The image is a screenshot of a technical paper titled "Using Fault Injection to Verify an AUTOSAR Application According to the ISO 26262 2015-01-0272" from SAE International. The paper is dated 2015-04-14. The abstract discusses the complexity and criticality of automotive electronic embedded systems and the need for functional safety standards like ISO 26262. It mentions that fault injection (FI) is introduced as a dedicated technique to assess the effectiveness of safety mechanisms and demonstrate the correct implementation of requirements.

### Using Fault Injection to Verify an AUTOSAR Application According to the ISO 26262 2015-01-0272

The complexity and the criticality of automotive electronic embedded systems are increasing today, and that is particularly the case for software development. The 26262 standard for functional safety is one of the answers to these challenges. It defines requirements on the development process in order to ensure the safety. To meet these requirements, fault injection (FI) is introduced as a dedicated technique to assess the effectiveness of safety mechanisms and demonstrate the correct implementation of requirements.

## Using Fault Injection to Verify According to the ISO 26262

The complexity and the criticality of automotive systems are increasing today, and that is particularly true for the ISO 26262 standard for functional safety. This standard defines requirements on the development of safety-critical systems, fault injection (FI) is an important effectiveness of safety mechanisms and requirements.

Manufacturers know the purchasers of these tools and their location. The majority of the second hand tools market is also controlled by the manufacturers.

Efficient use of these tools requires a very long experience and can only be done by a small number of people. Nevertheless, one cannot exclude the fact that a certain type of equipment may be accessible through university laboratories or equivalent but expertise in using the equipment is quite difficult to obtain.

**Table 9: Rating for tools (II)**

| Tool  | Equipment |
|---|-----------|
| X-ray 3-D tomograph                                     | Bespoke   |
| New Tech Design Verification and Failure Analysis Tools | Bespoke   |

Note, that using bespoke equipment should lead to a moderate potential as a minimum.

The level "Multiple Bespoke" is introduced to allow for a situation, where different types of bespoke equipment are required for distinct steps of an attack.

**Table 10: Rating for Equipment**

| Equipment        | Identification | Exploitation |
|------------------|----------------|--------------|
| None             | 0              | 0            |
| Standard         | 1              | 2            |
| Specialized*     | 3              | 4            |
| Bespoke          | 5              | 6            |
| Multiple Bespoke | 7              | 8            |

\*If clearly different test benches consisting of specialised equipment are required for distinct steps of an attack this shall be rated as bespoke.

Equipment can always be rented but the same quotation applies with one exception: Bespoke equipment, which can

| 25 – 34.5        | Moderate  |
| 35 and above     | High  |

# ENISA SoTA: Application of attack potential to hardware devices with security boxes (HWSB)

## Attack potential rating example

Attack scenario:

- **Target:**
  - Bypass FW signature verification during FW update process with the target to load a forged FW with malicious code.
- **Identification of (potential) vulnerability:**
  - When wrong FW is processed, different error messages are received.
  - The verification of the FW might not be protected against faults.
- **Attack method:**
  - Perturbation attack using Voltage glitch

## ENISA SoTA: Application of attack potential to hardware devices with security boxes (HWSB)

### Attack potential rating example

|                        | Identification |
|------------------------|----------------|
| Elapsed time           |                |
| Expertise              |                |
| Knowledge of TOE       |                |
| Access to TOE: Samples |                |
| Equipment and tools    |                |
| Windows of Opportunity |                |
| Final table            |                |

Table 1: Rating for Access to TOE

| Access to TOE (samples)   | Identification | Exploitation |
|---------------------------|----------------|--------------|
| Non-functional sample     | 1              | 1            |
| Functional samples        | 2              | 2            |
| Fully operational samples | 4              | 4            |

If more than one sample is required in any category, instead of multiplying the points by the number of samples, the following factors must be used.

Table 7: Factor to rate the samples

| Number of Devices | Factor |
|-------------------|--------|
| 1                 | 1      |
| 2                 | 1.5    |
| 3-4               | 2      |
| 5-10              | 4      |

## ENISA SoTA: Application of attack potential to hardware devices with security boxes (HWSB)

| Equipment and tools    | 3                              | 4            |
| Windows of Opportunity | 0                              | 0            |
| Final table            | 11                             | 12           |
|                        | 21 (Enhanced-Basic resistance) |              |

## ENISA SoTA: Application of attack potential to hardware devices with security boxes (HWSB)

### Attack potential rating example

|           | Identification   | Exploitation  |
|-----------|------------------|---|
| Elapsed   | Range of Values* | TOE resistant to attackers with attack potential of |
| Expertis  | 0 – 13.5         | No rating   |
| Knowled   | 14– 15.5         | Basic   |
| Access t  | 16 – 24.5        | Enhanced – Basic                                    |
| Equipme   | 25 – 34.5        | Moderate  |
| Windows   | 35 and above     | High  |
| Final tab |                  | 21 (Enhanced-Basic resistance)                      |

## ENISA SoTA: Application of attack potential to hardware devices with security boxes (HWSB)

### Harmonized criteria to rate attack difficulty:

- Supports **layered defense strategy** helping to prioritize testing investment
- Easier **quantification of cost of the attacks (in USD)**
- Promotes **budget-efficiency** while clarifying criteria for laboratories.

# SESIP Assurance Levels & Protection Profiles

## SESIP contribution for Automotive sector

- Objective to reduce the cost, complexity, and effort associated with security evaluations.
- Emphasis on modularity and the reuse of certified components.

### **Modular Evaluation:**

Automotive systems comprise various components like ECUs, telematics units, and infotainment systems. SESIP allows for individual evaluation of these components, facilitating targeted security assessments.

### **Reuse of Certified Components:**

Manufacturers can integrate previously certified components into new systems without re-evaluating the entire system, saving time and resources.

### **Support for ISO/SAE 21434 Compliance:**

SESIP's methodology supports compliance with ISO/SAE 21434, the international standard for automotive cybersecurity risk management.

## SESIP Assurance Levels

### Adapt SESIP to your risk assessment:

- SESIP levels let you tailor assurance to risk
- Avoid overengineering: not every ECU needs SESIP 5
- Enables scalable security investment based on product criticality

**LEVEL 1: SELF-ASSESSMENT**

Utilizing public tools to discover publicized potential vulnerabilities

**LEVEL 2: BLACK-GREY BOX PENETRATION TESTING**

Adding vulnerability analysis and penetration testing

**LEVEL 3: WHITE BOX VULNERABILITY ANALYSIS AND PENETRATION TESTING**

Adding source code review

**LEVEL 4: REUSE OF S0G-IS CC EVALUATION**

More evidence and higher attack potential

**LEVEL 5: REUSE OF S0G-IS CC EVALUATION**

More evidence and higher attack potential (ex. for secure element)

**Fragmented and cost-sensitive automotive supply chain, SESIP offers flexibility.**

For example, you can assign SESIP 2 for a temperature sensor, and SESIP 3 for a gateway that handles over-the-air (OTA) updates.

This ensures resources are focused where they yield the highest security value. The SESIP model supports iterative and modular certification, reducing total cost of ownership.

## SESIP Assurance Levels

Adapt SESIP to your risk assessment:

### LEVEL 1: SELF-ASSESSMENT

| Range of Values* | TOE resistant to attackers with attack potential of |
|------------------|---|
| 0 – 13.5         | No rating   |
| 14– 15.5         | Basic   |
| 16 – 24.5        | Enhanced – Basic                                    |
| 25 – 34.5        | Moderate  |
| 35 and above     | High  |

Fragmented and cost-sensitive automotive supply chain, OEMs require flexibility.

For example, you can assign SESIP 2 for a temperature sensor, and SESIP 3 for a gateway that handles over-the-air (OTA) updates.

This ensures resources are focused where they yield the highest security value. The SESIP model supports iterative and modular certification, reducing total cost of ownership.

## SESIP Protection Profiles

### Why Protection Profiles Matter

- Define security objectives and scope early
- Enable harmonization across the supply chain
- Lower certification cost

The screenshot displays the Global Platform website's 'SESIP' section. The header includes the Global Platform logo and navigation links: ABOUT, SESIP, TECHNOLOGY, CERTIFICATION, EDUCATION, COMMUNITY, NEWS & EVENTS, LOGIN, and a search icon. The language is set to ENGLISH. The main content area lists several SESIP profiles, each with a document icon, title, version, ID, and publication date. The profile 'SESIP Profile for Secure External Memories v1.1 | GPT\_SPE\_148' is highlighted with an orange border. Other visible profiles include 'SESIP to RED-hEN Mapping v1.0 | GPS\_NOT\_021', 'SESIP Profile for DTSec Connected Diabetes Device Platforms v1.0 | GPT\_SPE\_151', 'Security Evaluation Standard for IoT Platforms (SESIP) Methodology v1.2 | GP\_FST\_070', 'Security Evaluation Standard for IoT Platforms (SESIP) FAQ v1.0 | GP\_FAQ\_112', and 'Cryptographic Algorithm Recommendations v3.0 | GP\_TEN\_053'.

| Icon | Title  | Version | ID          | Published          | Action |
|------|--|---------|-------------|--------------------|--------|
|      | SESIP to RED-hEN Mapping   | v1.0    | GPS_NOT_021 | Published Mar 2024 | +      |
|      | SESIP Profile for DTSec Connected Diabetes Device Platforms        | v1.0    | GPT_SPE_151 | Published Jan 2024 | +      |

|      | SESIP Profile for Secure External Memories                         | v1.1    | GPT_SPE_148 | Published Sep 2024 | +      |
|      | SESIP Profile for Secure MCUs and MPUs                             | v1.0    | GPT_SPE_150 | Published Nov 2021 | +      |
|      | Cryptographic Algorithm Recommendations                            | v3.0    | GP_TEN_053  | Published Apr 2025 | +      |

## SESIP Protection Profiles

### Why Protection Profiles Matter

- Define security
- Enable harmonized chain
- Lower certification

#### SESIP Efficiency (SFRs)

Identification  
and Attestation

Product Life  
Cycle

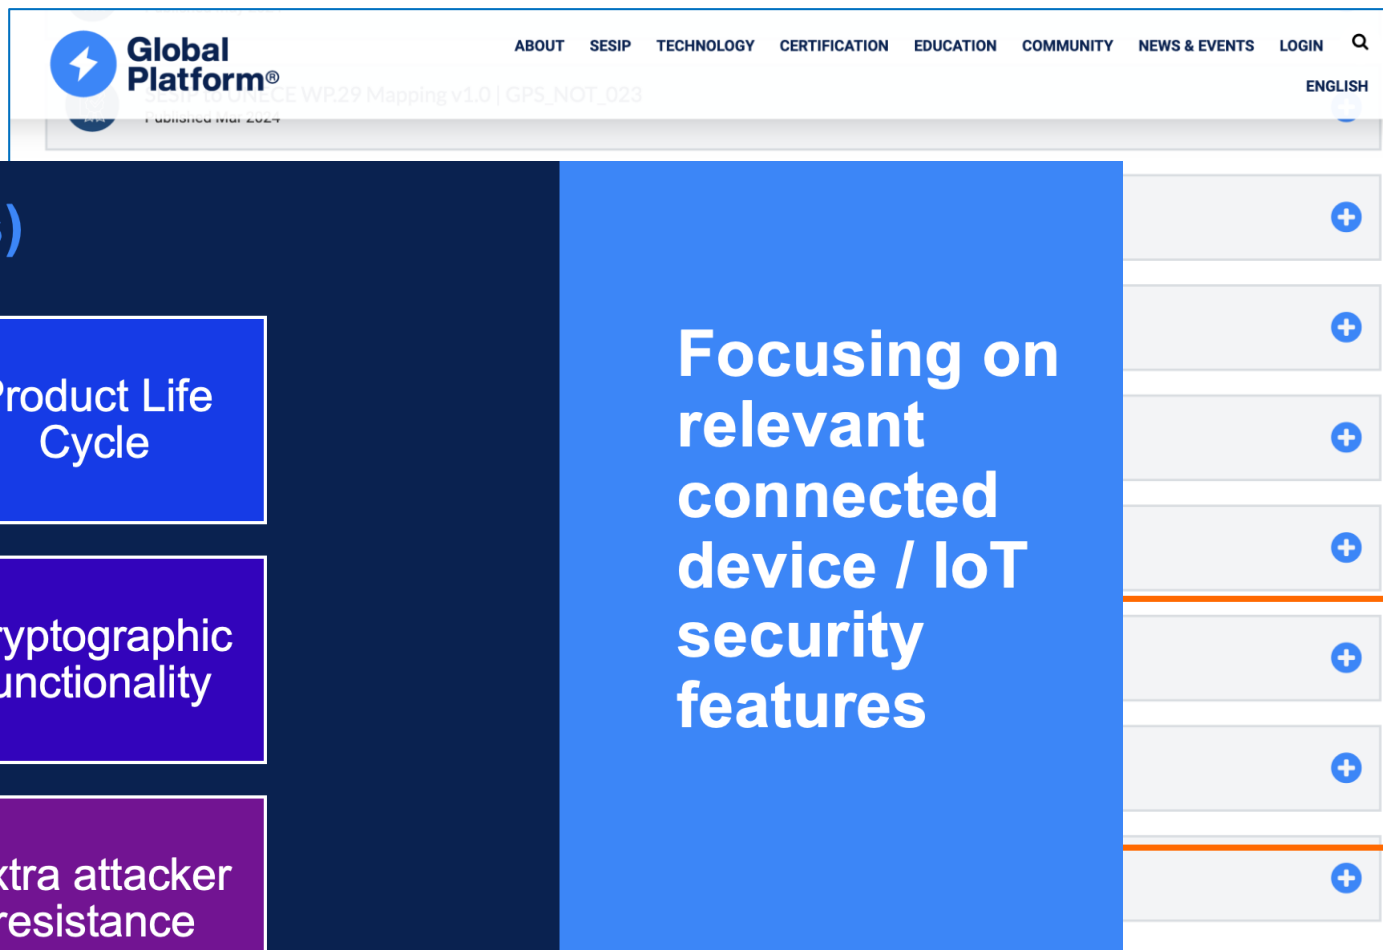

Secure  
Communication

Cryptographic  
functionality

Compliance  
functionality

Extra attacker  
resistance

Focusing on  
relevant  
connected  
device / IoT  
security  
features

## GlobalPlatform role within the certification ecosystem

### Continuous work to adapt to industry needs:

- **Technical working groups** to standardize criteria and requirements
  - Harmonize criteria for attacks (i.e., minimum/maximum attack scoring for specific attack scenarios)
  - Harmonize acceptance on ad-hoc approaches (i.e., test witnessing in vendor facilities)
- **ITSEFs** in alignment with certification bodies to adapt requirements to discuss ad-hoc approaches for specific use cases.
  - Workshop to go through implementation instead of in-house code review
  - Specific test-setups to facilities exposure of attack surface
  - Alternative functional test methods to demonstrate compliance

## SESIP Assurance Levels and Protection Profiles

**A common and optimized approach for evaluating the security of connected products:**

- General model similar to CC
- Granularity
- Requirement hierarchy
- Profiles

# Final thoughts

## Key Takeaways

### ENISA's Attack Potential Method:

Harmonized criteria to rate attack difficulty

### SESIP Certification:

A common and optimized approach for evaluating the security of connected products
